Auto Ticket Classification using Flow Designer

BRAINSTORMING & IDEATION PHASE

1. Project Idea

- The project idea is to automate classification of school IT helpdesk incident tickets using ServiceNow Flow Designer.
- The system analyzes the ticket Short Description and Description fields and identifies the issue type from predefined keywords.

2. Problem Identified

- The school IT helpdesk receives multiple requests such as Wi-Fi issues, projector failures, password problems, and slow computers.
- IT staff currently review each request manually and select the appropriate category and subcategory.
- Manual classification is time-consuming, error-prone, and difficult to scale as ticket volume increases.

3. Brainstormed Solution

- Use ServiceNow Flow Designer as a no-code automation solution.
- Create predefined categories: Network, Hardware, Access, and Performance.
- Create matching subcategories: Wi-Fi, Projector, Forgot Password, and Slow Computer.
- Trigger the flow when a new incident record is created and Category is empty.
- Use keyword-based conditions to automatically update Category and Subcategory.
- Send an email notification to the caller after ticket creation.

4. Classification Logic

- WiFi or Network → Category: Network; Subcategory: Wi-Fi.
- Projector → Category: Hardware; Subcategory: Projector.
- Password or Login → Category: Access; Subcategory: Forgot Password.
- Slow or Hanging → Category: Performance; Subcategory: Slow Computer.

5. Expected Benefits

- Reduce manual effort for IT agents.
- Improve consistency in ticket classification.
- Improve ticket routing efficiency.
- Provide a maintainable no-code solution.
- Support future scalability.
