Auto Ticket Classification using Flow Designer

PROJECT PLANNING PHASE

1. Project Goal

- Plan an automated school IT ticket classification workflow using ServiceNow Flow Designer.
- The planned system should classify tickets, store structured information, and notify the caller.

2. Project Scope

- Incident/ticket creation and classification.
- Category and Subcategory management.
- Dependent choice configuration between Category and Subcategory.
- Flow Designer automation.
- Caller email notification.
- Testing, validation, update set completion, and deployment preparation.

3. Planned Components

- ServiceNow Incident Workflow custom table.
- Required ticket fields including Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group, and Assigned to.
- Project Update Set for capturing configuration changes.
- Flow named Auto Classify School IT Tickets.
- Email notification action.

4. Planned Work Sequence

- Create a Project Update Set and make it the current set.
- Create the custom Incident Workflow table.
- Create and configure ticket fields.
- Configure Category choices and Subcategory choices.
- Configure Category as the dependent field for Subcategory.
- Create the Flow Designer flow and trigger.
- Add classification conditions and update-record actions.
- Configure email notification.
- Activate and test the flow.
- Complete and export the update set.

5. Planning Outcome

- The planned workflow provides a clear path from ticket creation to automatic classification, notification, testing, and deployment.
