Auto Ticket Classification using Flow Designer

REQUIREMENT ANALYSIS PHASE

1. Existing Process

- Students and teachers submit IT support requests for network connectivity, hardware failures, account access, and system performance problems.
- IT staff manually identify the issue type and select Category and Subcategory.

2. Functional Requirements

- The system must automatically classify IT tickets based on the issue description.
- The system must assign both Category and Subcategory without manual intervention.
- The system must support dependent choice logic between Category and Subcategory.
- The system must send an automated email notification to the caller upon ticket creation.
- The system must store ticket information in a structured and standardized format.
- The system must be easy to maintain and support future scalability.

3. Data Requirements

- Number: Auto Number.
- Caller: Reference to sys_user.
- Category: Choice field with Network, Hardware, Access, and Performance.
- Subcategory: Choice field with Wi-Fi, Projector, Forgot Password, and Slow Computer.
- Short Description: String.
- Description: String.
- State: Choice field with New, In progress, On hold, Resolved, and Closed.
- Assigned Group: Reference to sys_user_group.
- Assigned to: Reference to sys_user.

4. Automation Requirements

- Trigger: Record Created.
- Table: Incident Workflow.
- Condition: Category is Empty.
- Flow logic must inspect Short Description and classify the ticket using predefined keywords.

5. Notification Requirement

- Send an email to the caller's email address.
- Subject: Your Request for the issue has been submitted.
- Body: Ticket confirmation message.
