Auto Ticket Classification using Flow Designer

PROJECT DESIGN PHASE

1. System Design Overview

- The design uses a ServiceNow custom table to store school IT ticket records.
- Flow Designer provides the automation layer for classification and notification.
- Category and Subcategory are designed as dependent choice fields.

2. Custom Table Design

- Table Label: Incident WorkFlow.
- Create module option is unchecked.
- Auto Number is enabled for ticket records.

3. Field Design

- Number — Auto Number.
- Caller — Reference (sys_user).
- Category — Choice.
- Subcategory — Choice.
- Short Description — String.
- Description — String.
- State — Choice.
- Assigned Group — Reference (sys_user_group).
- Assigned to — Reference (sys_user).

4. Category–Subcategory Dependency

- Wi-Fi is dependent on Network.
- Projector is dependent on Hardware.
- Forgot Password is dependent on Access.
- Slow Computer is dependent on Performance.
- When a Category is selected, the available Subcategory options are controlled by that Category.

5. Flow Design

- Flow Name: Auto Classify School IT Tickets.
- Trigger: Record Created on the Incident Workflow table.
- Trigger condition: Category is Empty.
- Use If / Else If conditions to inspect the Short Description.
- Use Update Record actions to set Category and Subcategory.

- Use Send Email action to notify the caller.
