Auto Ticket Classification using Flow Designer

PROJECT DOCUMENTATION PHASE

1. Documentation Purpose

- Document the complete Auto Ticket Classification using Flow Designer implementation so that the configuration can be understood, demonstrated, maintained, and reused.

2. Project Documentation Contents

- Problem statement and objectives.
- Business requirements.
- Project Update Set creation.
- Custom table creation.
- Field and data type configuration.
- Category and Subcategory dependency.
- Flow Designer trigger and classification logic.
- Email notification configuration.
- Testing and validation scenarios.
- Deployment and update set export steps.

3. Important Project Configuration

- Flow Name: Auto Classify School IT Tickets.
- Custom Table: Incident Workflow.
- Classification is based on keywords in Short Description.
- The flow uses Update Record actions to set Category and Subcategory.
- The flow uses Send Email action to notify the caller.

4. Classification Documentation

- WiFi/Network → Network → Wi-Fi.
- Projector → Hardware → Projector.
- Password/Login → Access → Forgot Password.
- Slow/Hanging → Performance → Slow Computer.

5. Maintenance Documentation

- The no-code Flow Designer approach makes the classification logic easier to maintain.
- Future classification rules can be added by extending the existing Flow Designer conditions and actions.
